NEUROPSYCHOLOGICAL CONSULTATION REPORT

RE: Joette H. Williams
DOB: August 28, 1950
AGE: 51
DATE OF INJURY: August 2, 2001
MEDICATIONS: Clonazepam, Effexor
DATE OF EXAMINATION: May 17, 2002

PRESENTING PROBLEM:

Severe anoxic brain injury, secondary to carbon monoxide poisoning. The patient indicates that her current symptoms center on persistent headaches and significant changes in cognitive and affective function.

BACKGROUND HISTORY:

History is extensively detailed in the chart. This patient suffered a prolonged CO poisoning at the end of July, the beginning of August 2001 due to a furnace malfunction. She reports that prior to this severe anoxic injury she was very healthy and "athletic". She had no significant neurologic history or disorder. Family history reveals surviving mother who is 80 years of age, who has some heart disease and macular degeneration. The father passed away at age 69 as a consequence of CVA. Educationally, the patient has an RN Degree and up to the time of the incident, she was an operating room nurse. She has not been able to work since.

BEHAVIORAL OBSERVATIONS/MENTAL STATUS EXAMINATION

Joette Williams is a 51-year-old female. She was on time for her appointment and was appropriately dressed and groomed. She was accompanied by a friend. She was oriented to time, place and person, but did display difficulty with retention of four words on mental status examination. She was aware of current events in the news. She was able to adequately interpret proverbs. She appeared depressed and anxious much of the time. She obviously put forth good effort, however, as validated by a near perfect performance on the TNM.

TESTS ADMINISTERED:

See attached data sheet.

Psychometrist: Elona Suli, M.D.

TEST RESULTS:

See attached data sheet for specific scores.

INTELLECTUAL FUNCTIONING:

WASI Results:

Full Scale IQ = 100

Given this patient's educational and vocational background, it would be expected that her scores should be a bit higher with regards to overall intellectual status. Accordingly, this probably does reflect some reduction.

ACADEMIC FUNCTIONING:

WRAT-III Results:

	Standard Score	Percentile	Grade Level Estimate
Reading	109	73	HS+
Spelling	104	63	HS+
Mathematics	84	14	6

Basic academic skill level is above average in reading and spelling and below average in mathematics. If standardized achievement scores are at all available from when this patient was in public school, it might help in identifying whether the low math performance is reflective of a residual deficit from the anoxic injury. With regards to academic functioning, the most common sequela associated with acquired brain injury is a deficit in mathematical ability.

PERSONALITY/EMOTIONAL FUNCTIONING:

The patient endorses a multitude of symptoms indicative of underlying psychological distress with prominent features of depression and anxiety. Results of BAI, SCL-90-R and Faschingbauer Short Form indicate endorsement of significant levels of psychological stress.

NEUROPSYCHOLOGIC FUNCTIONING:

This patient is left-side dominant for hand and foot, but displays mixed ocular dominance. Clinical motor and sensory-perceptual studies were within the broad context of normal. Motor examination reveals adequate finger oscillation speed and grip strength, although only in average ability range. Sensory-perceptual findings reveal no specific deficits in tactile, auditory, vision or olfactory function, although a variety of errors were made. These could be secondary to attentional problems. Language evaluation reveals reduced fluency and marginal naming. She also displayed some right-left

Page 3

confusion on the Aphasia Screening Test. Basic visual/spatial function was intact as evidenced by average performance on the Hooper VOT and the Raven CPM. She was slow on Trails B and displayed impairment on executive function with regards to poor performance on the Category and Wisconsin Card Sort Test. Memory studies reflect considerable scatter, but with a general theme indicative of deficits in short-term memory function.

NEUROIMAGING FINDINGS:

Normal brain SPECT examination. MRI: Multiple, scattered foci of T2 and FLAIR hyperintense signal abnormalities within the white matter.

IMPRESSION:

Status post severe anoxic encephalopathy secondary to carbon monoxide poisoning with current neuropsychologic studies reflecting deficits in memory executive and affective function.

RECOMMENDATIONS:

This patient is an appropriate candidate for a comprehensive and integrated cognitive rehabilitation treatment program, however, the difficulty here will be what is available in her region.

Dear Mrs. Williams:

Thank you for coming in for neuropsychological consultation, and as I reviewed with you today, your test results do reflect what we typically find in patients who have experienced CO poisoning to the level that you did.

Specifically, the test results indicate problems in short-term memory, attention/concentration and what we term executive function. These problems can be helped with cognitive rehabilitation therapies. We have looked at the National Academy of Neuropsychology directory and have not found a neuropsychologist in the Spartanburg, South Carolina region where you live. Accordingly, I am at a little bit of a loss as to what is available in your area, but maybe there is a local psychology group who could give some advice on finding a local clinical neuropsychologist. The treatment approach is a team approach that involves a clinical neuropsychologist, psychiatrist for medical management, particularly with respect to medications that help stabilize mood, and potential medications that may be helpful with regards to memory, and a neurologist.

You should have follow up neuropsychological testing on a regular basis, and I would recommend the next exam be in approximately one year's time.

Please let me know if I can be of any further help or assistance.

Sincerely,

Erin D. Bigler, Ph.D.

Diagnosis: 854.00

DISTRIBUTION DATE: May-16-200

HISTORY: Head trauma.

RADIOPHARMACEUTICAL: 26.1 mCi Tc99m Neurolite

PROCEDURE: 45 minutes after the intravenous administration of Tc99m Neurolite, SPECT images of the brain were obtained.

FINDINGS: There are no focal or diffuse areas of abnormally increased or decreased activity within the cerebral or cerebellar cortices, or the basal ganglia. There is symmetrically increased activity within the visual cortices.

IMPRESSION:

NORMAL BRAIN SPECT EXAMINATION.

THE INCREASED ACTIVITY WITHIN THE VISUAL CORTICES SUGGESTS VISUAL ACTIVITY DURING OR SHORTLY AFTER INJECTION.

EXAM: MRI3 BRAIN WO CON IBIGLERBSPII

Diagnosis: 784.0

DISTRIBUTION DATE: May-16-2002

History: Bigler protocol. Anxiety and difficulty with concentration.

Technique:

Axial: Fast echo T2, FLAIR, T1, gradient recalled
Sagittal: 3-D T1 weighted SPGR

Findings: No comparisons are available.

There are scattered linear and nodular foci of T2 hyperintense signal within the deep white matter. There is a 3 mm nodular focus within the right peri-occipital white matter, as well as multiple small foci within the centrum semiovale bilaterally. They are identified on the corresponding FLAIR images as increased signal, except for a single lesion within the left posterior centrum semiovale where there is central hypointense signal, with surrounding hyperintense signal. These are nonspecific findings.

There is no extra axial fluid collection identified. There is no shift of midline structures. The basilar cisterns are patent. The size of the ventricles and sulci are within normal limits for the patient's stated age. The brainstem, cerebellum and brachium pontis are unremarkable bilaterally. The extra calvarial soft tissues are unremarkable. The orbits are grossly unremarkable.

There is mild mucosal thickening of the maxillary sinuses and ethmoid air cells. There may be a small air/fluid level within the left maxillary sinus. The mastoid air cells are well-aerated. There is persistence of the normal flow voids within the major intracranial arteries. No fracture of the skull is identified.

IMPRESSION:

MULTIPLE, SCATTERED FOCI OF T2 AND FLAIR HYPERINTENSE SIGNAL WITHIN THE WHITE MATTER AS DESCRIBED ABOVE. THIS IS A NONSPECIFIC FINDING. THIS MAY BE THE RESULT OF ADVANCED WHITE MATTER SMALL VESSEL ISCHEMIC DISEASE, ALTHOUGH A DEMYELINATING PROCESS OR THE SEQUELA OF TRAUMA IS NOT EXCLUDED.

THERE IS NO MR EVIDENCE OF EXTRA AXIAL HEMORRHAGE.

NO ACUTE INTRACRANIAL PROCESS EVIDENT.
